Series Number: I

Number of Pages: 320

Abstract: This publication is one of a series of reports presenting socio-economic data for small areas within Maryland. This report tabulates and maps data pertaining to educational attendance and attainment. The data were derived from the 1970 Census of Population and Housing.

The report provides basic data on two subject areas of educational performance for election districts and places with a population of 2,500 persons or more in 1970. The two aspects considered are educational attendance of the population under 34 years of age, and educational attainment for persons 25 years of age and over. Limited data on vocational training is also included. Selected indicators were mapped by region at the election district level.

This report was developed to provide information that could assist educational planning programs as well as provide one portion of an integrated set of socio-economic data for small areas in Maryland. It is hoped that this data will assist in creating a comprehensive State data base, and in problem identification and program planning at the local, county and regional level.

November 15, 1973

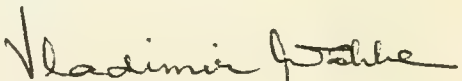

The Honorable Marvin Mandel  
Governor of Maryland  
State House  
Annapolis, Maryland 21404

Dear Governor Mandel:

I am pleased to transmit herewith the report entitled "Maryland 1970 Social Indicator Series, Volume I: Educational Characteristics". This report is the first of a series designed to provide State, regional and local agencies and also private individuals with basic information regarding the social and economic characteristics of the population of Maryland.

Based upon data retrieved from the 1970 Census of Population and Housing, this report provides information concerning the educational attendance and attainment status of persons in Maryland in 1970 broken down by small areas. As such, the report should prove to be a valuable guide to educational planning throughout the State.

Sincerely,

  
Vladimir Wahbe

Enclosure

## INTRODUCTION

This report is one of a series of Social Indicator Reports developed by the Maryland Department of State Planning. The series is designed to assist in the identification of varying social conditions in Maryland. It serves as an initial analysis component for the preparation of the Maryland Human Resources Plan and provides a basis for the setting of quantifiable achievement objectives for specific program areas.

Each report in the series deals with a specific topic. These include age composition and mobility, education, housing, journey to work, labor force and occupational mix, and income. The 1970 Census of Population and Housing Fourth Count Summary Tapes were used as the data base. This allows the data to be utilized as a benchmark for the evaluation of change in social performance over time. In addition, comparable data at the State and national level are readily available for all measures utilized. The social indicators are tabulated by State, planning region, county, minor civil division (election district) and places with a population of 2,500 or more persons for the total, white and nonwhite population groups.

Computer-prepared maps for planning areas of the State are included in the report series. These maps provide the user with insights into the relevance of the social indicators within the context of urban, suburban, and rural locations. The relationship of small area problems to a broader geographic framework can be readily analysed using this approach.

In the text of each report, illustrative uses of the data are suggested. These are by no means all-inclusive, but serve as a guide to the user in interpreting and utilizing the data.

## I. EDUCATIONAL CHARACTERISTICS

The purpose of this report is to provide information on two indicators of the State's educational profile; namely, the utilization of the existing educational facilities by the younger portion of the population and the educational attainment levels of the adult population. These indicators were selected to give a general overview of educational attainment levels of the resident adult population throughout the State and to provide an insight into the future attainment levels of the State's human resources stock as measured by the current attendance levels in Maryland's educational institutions.

The statistics used to describe current enrollment characteristics for 1970 are shown both by school enrollment figures and enrollment rates for selected age groups. When viewed in combination with the educational attainment data for the population 25 years of age and over, it is possible to infer changes in future attainment levels for small areas and by race. Enrollment rates for the population 18 to 21 and 22 to 34 years old are particularly useful, as these provide some indication of the changes in quality of the State's human resource stock that may be anticipated in the near future. They are useful also for identifying areas requiring additional educational facilities and areas requiring programs to increase local school enrollment levels.

The attribute describing educational attainment of the population 25 years of age and over serves as one indicator of the level of educational development, with reference to existing institutional standards of achievement for different sectors of the adult population. This is of considerable significance when analysing the potential human resource base available

in the State, and the need for new or expanded educational advancement programs. Additional information is provided by the median education statistics, which are useful for creating a capsule image of the area's economic development when used in conjunction with other median indicators, such as family income and age. The inclusion of data referring to vocational training of the population sixteen to sixty-four years old with less than fifteen years of school identifies one type of post-secondary school education and relates directly to the quality of the skilled labor force. The data is too generalized to provide additional perspective on educational attainment characteristics for the State, however, its value lies in its use as benchmark data for future studies.

Statistics tabulated for the white and nonwhite sectors of the population at the minor civil division (MCD) or place level (for areas outside the two metropolitan regions and Southern Maryland Region) should be interpreted with some caution. The small size of the resident population that is classified as nonwhite makes comparisons of relative statistics difficult.

## II. DESCRIPTION OF EDUCATION INDICATORS

Census definitions of the concepts used in this report are contained in a later section entitled "Definitions". It is recommended that users consult that section carefully before analysing the data.

### School Enrollment Data

School enrollment data were derived from the fifteen percent sample of the Census questionnaires. Two classifications of school enrollment statistics are provided. First, the absolute number of persons enrolled in school details attendance for the five main educational levels: nursery school, kindergarten, elementary school, secondary school, and college. Second, the enrollment rate indicates the percentage of the population enrolled in school, with age groupings corresponding to the main educational levels. For example, the 5 to 13 and 14 to 17 age groups correspond to elementary and secondary school enrollment, persons 18 to 21 are generally enrolled in either high school or college, and persons 22 through 34 may be enrolled in college.

The high enrollment rates generally noted for persons in the 5 to 13 and 14 to 17 year age groups reflect the compulsory attendance of persons 6 to 16 years of age. The only persons exempt from this are persons "whose mental, emotional or physical condition is such as to render (their) instruction...inexpedient or impractical".<sup>1</sup>

In some areas, low enrollment rates may indicate the presence of exempt persons or a below average enrollment of persons not in the compulsory age group, that is, persons 5 years old and persons 17 years old.

---

<sup>1</sup> Maryland School Bulletin, The Public School Laws of Maryland, Vol. XLVI, No. 1, Article 77, No. 92, (a), P.59.

The qualification regarding comparability of data for the white and nonwhite population sectors is particularly applicable to the enrollment rates. The detailed breakdown of the population base by age group and race may create wide variations in relative educational performance among MCD's, particularly in areas with a small nonwhite population. Any statistics calculated from the raw data may show significant variations from comparable statistics for the white population because of the small number of observations. This would preclude detailed analysis of the local performance of the particular indicator.

#### Educational Attainment Data

The educational attainment level is tabulated here for persons twenty-five years of age and over.<sup>2</sup> The information was obtained from the twenty percent sample of Census questionnaires. The data are grouped to relate formal years of schooling with the main benchmarks in institutional training. These data sets identify population into six major groups of educational attainment: 1) the proportion of the population that has had no schooling, or has completed some or all of elementary school, 2) the proportion that has completed some high school, 3) the proportion that has completed high school, 4) the proportion of persons with some college, 5) the proportion with an undergraduate degree, and 6) the proportion with some post-graduate training.

The median education level is a useful tool for comparisons of the average level of educational attainment for small areas, and complements the educational attainment rates. Both figures are given for males

---

<sup>2</sup> This division point is adopted from the Census data tabulations. For Maryland, Census data indicates that 97.5 percent of the population twenty-five and over have completed their formal education and are potentially members of the labor force.

and females separately to highlight differences in the attainment levels by sex.

#### Vocational Training Data

Statistics for vocational training, obtained from a five percent Census sample, provide additional perspective to the educational attainment levels. Unfortunately, the vocational training data cannot be broken down by type of training received for each geographic area.

### III. REVIEW OF STATISTICS

A general review of the data pinpointed several facts regarding Maryland's educational performance. A discussion of these points and suggestions for further use of the data, particularly at the MCD and place level, will be outlined in this section. The data should be useful to planning agencies concerned with the adequacy and sphere of influence of existing educational institutions, the need for adult education programs, and the differences in educational characteristics between areas.

A series of computer maps<sup>3</sup> was prepared for use in the social indicator reports. The mapping of selected attributes highlights local differences in educational attendance and attainment characteristics. This mapping technique provides ready visual comparison of any element of a data set for the State, region, county or MCD level of detail. In this report series, selected data are mapped by MCD to assist in interpretation of the statistics. The maps are useful for describing spatial interrelationships between characteristics, or comparing performance of a single attribute between areas, or both.

It should be re-emphasized at this point that the data contained in this report should not be considered in isolation. The indicators contained in all of the reports of this series are closely interrelated, and any study of a particular topic should be multivariate in nature. For example, factors such as migration patterns, job opportunities, labor force composition and locational considerations, to name but a few, significantly affect the observed education attainment pattern. Thus, it would

---

<sup>3</sup> The initial program to generate computer maps was provided by Dr. David Cowen and Dr. Paul Lovingood, Department of Geography, University of South Carolina.

be erroneous to conclude, for example, that relatively low levels of educational attainment were detrimental to an area's development, without first reviewing the existing labor market opportunities, labor supply, and the area's locational potential for economic expansion.

#### A. School Enrollment

1. Kindergarten and, to a greater degree, nursery school attendance appear to be positively related to urban location. Higher nursery school enrollments in urbanized areas may be associated with the labor force participation rates for urban females. Most MCD's show much higher enrollment figures for whites than nonwhites for both kindergarten and nursery school.

The MCD and place data, in conjunction with population base data, should provide detail for localized studies concerning the adequacy of existing public and private nursery school facilities, and for studies assessing the adequacy of kindergarten facilities in attracting students from the surrounding rural areas.

2. College enrollment figures are highly centralized around existing college facilities. This is graphically illustrated by comparing the regional maps showing accredited institutions of higher education, and the data describing college enrollments. Again, enrollment figures for white persons are significantly higher than for nonwhite persons.

The data for college enrollment figures can assist in determining the adequacy of existing college facilities, and the need for new facilities in more isolated parts of the State. In addition, the statistics are useful for studies concerned with racial differences in college attendance which refer specifically to locational factors.

3. School enrollment rates show a similar urban orientation.

The rates for the 5 to 13 and 14 to 17 year age groups, which include the age group covered by compulsory attendance, show very high rates, except for certain rural areas which are less accessible to educational facilities. These include northwestern Garrett County, eastern Allegany County, and scattered MCD's on the eastern shore.

The geographical array of the data can identify such problem areas for further in-depth study by State, regional and local officials attempting to enforce a state-wide level of school attendance.

4. The enrollment rates for persons 18 to 21 include persons attending both college and high school, and do not show as much sensitivity to accessibility of colleges as those rates for persons 22 to 34 years of age. A comparison of labor force participation rates and school enrollment rates at the county level may be informative in terms of the variation in behaviour between urban and rural groups. These data also provide supportive information for studies by institutes of higher education concerned with relative school dropout rates and attractiveness of college or vocational training facilities.

5. Enrollment rates for the nonwhite population sector generally tend to be lower than those for the white population sector. This is particularly noticeable for the 18 to 21 and 22 to 34 year age groups, and is supportive of the low nonwhite college enrollment figures noted earlier. The maps indicating enrollment rates for persons 18 to 21, by race, highlight this observation. A comparison of these data at the regional level with labor force participation rates for nonwhite males and females shows that in both cases, rates are generally lower than for white males and females. A detailed analysis of the data to determine whether there is a weaker tie

between these competing opportunities for nonwhites than for whites would be useful for programs designed to improve educational and job opportunities for minority groups.

6. Regional variations in school enrollment rates show a definite pattern relating high rates to the urbanized areas. This is particularly evident for the 18 to 21 and 22 to 34 year age groups. A review of the data at the MCD level shows the existence of a continuous corridor of high enrollment rates which extends from north of Baltimore City, southwest through Howard County to the contiguous areas of Montgomery and Prince George's counties abutting the northwestern boundary of Washington, D.C. Outside of the Baltimore-Washington corridor, enrollment rates appear relatively low, with the exception of areas around specific urban centers. A comparison of white and nonwhite enrollment rates indicates that the corridor pattern is less pronounced for the nonwhite sector, and is not continuous. This information would be useful in comparing educational attendance by race and geographic area for regional planning of educational facilities.

7. The data suggest that the educational performance of the Baltimore Region is below the level for Maryland. However, a more detailed review of the data indicates that only Carroll County, parts of Baltimore City, and some outlying MCD's consistently show low enrollment rates. By contrast, the suburban areas around Baltimore City, particularly to the north and west, and the areas adjacent to the city showed high enrollment rates. Enrollment rates for nonwhites, while generally lower than for whites, appear high in most of the Region. Further study of this observation would be useful in determining a planning strategy necessary to improve educational enrollment rates in the Baltimore SMSA. Similar anal-

yses of the regional performance of the Washington SMSA could utilize the data provided here in conjunction with similar data for Washington, D.C. and the Virginia suburbs.

#### B. Educational Attainment

1. Educational attainment levels for males and females show distinctly different patterns. A greater proportion of males than females tend to receive some post secondary school education, while a greater proportion of females tend to complete high school. The nonwhite population shows slightly different trends, with a higher proportion of females in both of the above-noted categories. This information is useful in assessing the underemployment of the population in certain areas, particularly the female population, and in determining the need for expanded local adult education facilities. At a more general level, it is a useful statistic for regional planning agencies interested in isolating inter-regional disparities in economic and social welfare.

2. A corridor of high attainment levels extends from north of Baltimore, southwest to Washington with an eastern arm through Greenbelt and Bowie in Prince George's County to the Annapolis area of Anne Arundel County. The maps showing median education level highlight this observation. In the remainder of the State, the main centers also show high attainment levels, with the outlying areas having a high proportion of residents with less than twelve years of schooling. This type of data manipulation would be useful in a multivariate analysis showing the relationships between education and income, and degree of latent labor force potential.

3. Educational attainment data may also help identify specific problem areas. It may be used in concert with income and labor force data,

for example, to identify areas requiring programs to alter local development. It may identify areas with low educational attainment levels, high proportion of unskilled labor, low labor force participation rates and low income, or even areas with the opposite characteristics.

### C. Vocational Training

1. A breakdown of vocational training by five major fields for Maryland is provided in Table 149 in the Department of Commerce Publication PC(1)-D22 Md. Almost half the males in Maryland who have completed vocational training by 1970 had taken courses in "trades and crafts". The second most frequent field of training was "business or office work", with "engineering and science" a close third. For females, on the other hand, the largest proportion of trained persons was trained in "business or office work", with "nursing or other health fields" ranking second (See Table 1).

2. In Maryland, there are a higher proportion of males with vocational training in both urban and rural areas. Urban rates are higher than rural rates, indicating a positive relationship between locations of economic activity and training. This might be a useful factor to consider when studying quality of labor supply, and income differentials between urban and rural persons with otherwise equivalent educational attainment levels. Regional studies to determine the need for programs to upgrade the labor supply or provide incentives to industry could benefit from this type of data.

3. For the female population as a whole, the nonwhite sector has a higher proportion of persons with vocational training residing in urban areas. This may indicate a difference between white and nonwhite females

in the type of education received for those with more than fifteen years of school. Further study of this observation may be useful in analysing labor force participation and occupational differences between white and nonwhite females.

#### IV. SUMMARY

Educational attendance and attainment levels show definite spatial patterns within Maryland. Both indicators appear sensitive to the relative accessibility of the area to urban concentrations and to racial composition of the constituent population.

Regional differences in performance are evident for both sets of indicators. The Western Maryland and Eastern Shore regions, in particular, consistently show a lower performance than the rest of Maryland in both educational attendance and attainment levels. This indicates that a continuation, and perhaps increase, in the differential performance of these areas and the remainder of the State will occur unless corrective measures are taken.

In the remainder of the State, proximity to urban centers, particularly the Baltimore-Washington corridor, is the most significant factor accounting for high attendance and attainment levels. The non-white population shows a lower performance than the white population in most areas, but in general follows the same pattern as the total population.

The chief value of the data lies in the provision of a significant body of small area data. The lack of comparable historical data reduces the value of the indicators for making detailed, long-term projections of school attendance. Nevertheless, a more detailed analysis of the data in conjunction with the age, income and labor force attributes will help highlight areas with chronic problems that can only be resolved through comprehensive, long-range social and economic programs.

## V. GUIDE TO USING THE DATA

The county level data are ordered alphabetically by region. The statistics for minor civil divisions (MCD's), election districts in Maryland, are additive to the county totals. Data for urban places are presented separately, as MCD boundaries cannot always be equated with those of a defined urban center. In some cases the county total derived from adding the MCD data differs slightly from the total given on the State summary tables. In these instances full data disclosure is not presented at the MCD level in order to insure confidentiality of responses in areas where there were very few individual responses from specific population groups. This may occur in sparsely populated areas or areas with a very small nonwhite population. In such cases, a minus one (-1) in the data at the MCD level may indicate such suppression of data.

Unincorporated centers are indicated by the letter "U" in parentheses after the place name. In cases where an urban place straddles two counties, this is indicated by the term "part", in parentheses, after the place name.

The accompanying maps can be used to assist in interpreting the MCD data for county, regional, or even State perspective. The degree of differentiation or homogeneity between contiguous areas with respect to a single or several indicators can be observed readily using the mapping technique. For example, the existence of a Baltimore-Washington corridor of high performance in certain indicators can be readily observed using the mapping technique.

The consistent use of a graduated set of symbols for data ranges can indicate the relative performance of a specific area, compared to other areas, for several indicators. The symbols highlight the existence or ab-

sence of spatial patterns of performance both within and across adjacent regions.

The maps can assist in the identification of areas which exhibit unusual performance with respect to a particular indicator. This can be useful in detecting areas which are strongly influenced by overriding factors such as population density or accessibility to urban areas. Urban-rural patterns of performance can be readily identified, which assists in the analysis of the data as presented in tabular form.

The maps provided in this report are only a selection of what were considered the more significant attributes. In the Educational Characteristics report, all mapped indicators can be derived directly from the tables presented in the report. The user is thus able to consider the actual value of a certain attribute for a specified area, and the relative performance of that area with respect to a defined range of values.

## VI. DEFINITIONS<sup>4</sup>

### Geographic Areas

Minor Civil Divisions--These are the primary political and administrative subdivisions of a county. In Maryland, it corresponds to an election district.

### Population Census Concepts

Urban-rural residence--This is one of the most important breakdowns of the population by geographic residence. Geographic areas are classified as urban or rural on the basis of their population size or density at the time of the census.

1. Urban population--Generally, all persons residing in areas determined to be urbanized areas or in places of 2,500 or more outside urbanized areas. A common breakdown of the urban population is given below.

- i) Population in central cities of urbanized areas.

- ii) Population in urban fringe of urbanized areas.

- Population in urbanized areas but not in central city.

- iii) Other urban population outside urbanized areas.

- Population in places of 2,500 or more outside urbanized areas.

2. Rural population--Population not classified as urban constitutes the rural population.

Race--This refers to the division of the population into white, Negro, and several other racial categories. These racial categories do not correspond to strict scientific definitions of biological

---

<sup>4</sup> Exerpted from the U.S. Bureau of the Census, 1970 CENSUS USERS' GUIDE; U.S. Government Printing Office, Washington, D.C., 1970.

stock. Persons were asked to indicate their race by selecting one of the following: White; Negro or Black; Indian (American); Japanese; Chinese; Filipino; Hawaiian; Korean; Other (specify). (In Alaska, Hawaiian and Korean were omitted and Aleut and Eskimo were added.)

### Education Concepts

Enrollment status--This is ascertained for persons 3 years and older, who are classified as enrolled in school if they attended regular school or college at any time since February 1, 1970. "Regular" schooling includes nursery school, kindergarten, and schooling leading to an elementary school certificate, high school diploma, or college degree.

Level and year or grade of school in which enrolled--Enrollment is classified into four levels with separate years or grades identified within each level with the addition of nursery school.

1. Nursery school--Identified in 1970, but not in 1960.
2. Kindergarten
3. Elementary school--Includes grades 1 through 8, identified separately in some tabulations. Persons enrolled in a junior high school are classified as enrolled in elementary school or high school according to year in which enrolled.
4. High school--Includes grades 9 through 12, identified separately in some tabulations. See elementary school, above, for treatment of junior high school enrollment.
5. College--Includes 1 through 5 academic years and 6 years or more, identified separately in some tabulations. College enroll-

ment is defined to include enrollment in junior or community colleges, regular 4-year colleges, and graduate or professional schools.

Years of school completed--This statistic refers to persons 3

years of age and over, who were asked the highest grade or year of regular school they ever attended up to 6 or more years of college. Persons attending school were asked the year they were completing. Persons were also asked whether they finished the year specified as the highest grade attended or were attending that year.

The number tabulated in each category of years of school completed includes persons who report completing that grade or year plus those who attended but did not complete the next higher grade. A common breakdown is no school years completed; 1-4, 5-6, 7, 8 years elementary; 1-3, 4 years high school; 1-3, 4 academic years or more college. Single years of the highest grade attended are carried on census basic records. Tabulations are commonly produced for particular age groups such as persons 14 and over, persons 25 and over, persons 14 to 24 not enrolled in school. This report produces the data for persons 25 and over, by 8 or less years of elementary school completed; 1-3, 4 years high school; 1-3, 4, 5 or more years college.

Median school years completed--This is calculated as the value which divides the population in half. Years of school completed statistics are converted into a continuous series: the first year of high school becomes grade 9, the first year of college grade

13, etc. Persons who have completed a given year are assumed to be evenly distributed from 0 to 9 of the year. For example, persons who have completed the 12th grade are assumed to be evenly distributed between 12.0 and 12.9.

Vocational training--This is ascertained for persons 14 to 64 years of age who were asked whether they ever completed a vocational training program; for example, in high school, as an apprentice, in a school of business, nursing, or trades, in a technical institute, or an Armed Forces school. Respondents were also asked to indicate the main field of such training as follows: business, office work; nursing, other health fields; trades and crafts; engineering or science technician, draftsman; agriculture or home economics; other field. Vocational training does not include courses received by correspondence, on-the-job training, or Armed Forces training not useful in a civilian job. This report produces the data for persons 16 to 64 years of age.
